

**Day 1 – Circle Vocabulary and Central Angles**

<b>Circle</b>	set of all points equidistant from a given point called the center of the circle	
<b>Chord</b>	a segment whose endpoints are on the circle	
<b>Diameter</b>	distance across the circle through its _____ (twice the length of the radius)	
<b>Radius</b>	distance from the center to point on circle (half the length of the diameter)	
<b>Secant</b>	a line that intersects the circle at exactly _____ points	
<b>Tangent</b>	a _____ that intersects the circle exactly ONE time	
<b>Point of Tangency</b>	where the tangent line intersects the circle	

Circles have \_\_\_\_\_ degrees.

Semicircles have \_\_\_\_\_ degrees.

**REMEMBER:** Vertical Angles are \_\_\_\_\_ and Linear Pairs are \_\_\_\_\_

**Practice:** Tell whether the line or segment is best described as a chord, a secant, a tangent, a diameter, or a radius—be specific!

a.  $\overline{AD}$

b.  $\overline{CD}$

c.  $\overline{EG}$

d.  $\overline{HB}$

e.  $\overline{FB}$

g.  $\overline{GK}$

### Arcs & Central Angles

An **arc** is an unbroken part of a circle consisting of two points called the endpoints and all the points on the circle between them.

Arc or Angle	Definition	Measure	Picture
Minor Arc	An arc whose points are on or in the interior of a central angle. Minor arcs are less than $180^\circ$ and only use two letters to name them.	The measure of a minor arc is equal to the measure of the central angle.	
Major Arc	An arc whose endpoints are on or in the exterior of a central angle. Major arcs are between $180^\circ$ and $360^\circ$ . Three letters are used to name a major arc.	The measure of a major arc is equal to $360^\circ$ minus the measure of its central angle or minor arc.	
Semicircle	An arc whose endpoints lie on a diameter. Semicircles are named using three letters.	The measure of a semicircle is $180^\circ$ .	
Central Angle	An angle whose vertex is the center of the circle.	The measure of a central angle is equal to the measure of its minor arc.	
Name	Theorem	Hypothesis	Conclusion
Arc Addition Postulate	The measure of an arc formed by two adjacent arcs is the sum of the measures of the two arcs.		

**Practice**

**Example:** Identify the following arcs are minor, major, or semicircle.

1. AE

2. FDE

3. FA

4. DFB

**Example:** Find the measure of the following:

1.  $m\widehat{AB}$

2.  $m\widehat{BC}$

3.  $m\widehat{AEC}$

4.  $m\widehat{BCA}$

**Example:** Find the measure of the following:

1.  $m\widehat{MN}$

6.  $m\widehat{MR}$

2.  $m\widehat{NQ}$

7.  $m\widehat{QMR}$

3.  $m\widehat{NQR}$

8.  $m\widehat{PQ}$

4.  $m\widehat{MRP}$

9.  $m\widehat{PRN}$

5.  $m\widehat{QR}$

10.  $m\widehat{MQN}$

**Example:** Find the value of  $x$ . Then find the measure of arc BC.
